Protocol for the Examination of Specimens from Patients with Carcinomas of the Nasal Cavity and Paranasal Sinuses

Protocol applies to all invasive carcinomas of the nasal cavity and paranasal sinuses. Mucosal malignant melanoma is included. Lymphomas, neuroectodermal neoplasms, and sarcomas are not included.

Based on AJCC/UICC TNM, 7th edition
Protocol web posting date: October 2009
Protocol effective date: January 2010

Procedures
• Biopsy
• Resection

Surgical Pathology Cancer Case Summary (Checklist)

Protocol web posting date: October 2009
Protocol effective date: January 2010

NASAL CAVITY AND PARANASAL SINUSES: Incisional Biopsy, Excisional Biopsy, Resection

Select a single response unless otherwise indicated.

Specimen (select all that apply) (Note A)
___ Nasal cavity
   ___ Septum
   ___ Floor
   ___ Lateral wall
   ___ Vestibule
___ Paranasal sinus(es), maxillary
___ Paranasal sinus(es), ethmoid
___ Paranasal sinus(es), frontal
___ Paranasal sinus(es), sphenoid
___ Other (specify): ____________________________
___ Not specified

Received:
___ Fresh
___ In formalin
___ Other (specify): ____________________________

Procedure (select all that apply)
___ Incisional Biopsy
___ Excisional Biopsy
___ Resection (specify type)
   ___ Partial maxillectomy
   ___ Radical maxillectomy
___ Neck (lymph node) Dissection (specify): ____________________________
___ Other (specify): ____________________________
___ Not Specified

*Specimen Integrity
* ___ Intact
* ___ Fragmented

Specimen Size
Greatest dimensions: ___ x ___ x ___ cm
*Additional dimensions (if more than one part): ___ x ___ x ___ cm

* Data elements with asterisks are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
Specimen Laterality (select all that apply)
___ Right
___ Left
___ Bilateral
___ Midline
___ Not specified

Tumor Site (select all that apply) (Note A)
___ Nasal cavity
   ___ Septum
   ___ Floor
   ___ Lateral wall
   ___ Vestibule
___ Paranasal sinus(es), maxillary
___ Paranasal sinus(es), ethmoid
___ Paranasal sinus(es), frontal
___ Paranasal sinus(es), sphenoid
___ Other (specify): ____________________________
___ Not specified

Tumor Focality (select all that apply)
___ Single focus
___ Bilateral
___ Multifocal (specify): ____________________

Tumor Size
Greatest dimension: ___ cm
*Additional dimensions: ___ x ___ cm
___ Cannot be determined (see Comment)

*Tumor Description (select all that apply)
*Gross subtype:
*___ Polypoid
*___ Exophytic
*___ Endophytic
*___ Ulcerated
*___ Sessile
*___ Other (specify): ____________________________

*Macroscopic Extent of Tumor
*Specify: ____________________________

* Data elements with asterisks are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
Histologic Type (select all that apply) (Note B)

Carcinomas of the Nasal Cavity and Paranasal Sinuses
___ Squamous cell carcinoma, conventional
    ___ Keratinizing
    ___ Nonkeratinizing (formerly cylindrical cell, transitional cell)

Variants of Squamous Cell Carcinoma
___ Acantholytic squamous cell carcinoma
___ Adenosquamous carcinoma
___ Basaloid squamous cell carcinoma
___ Papillary squamous cell carcinoma
___ Spindle cell squamous cell carcinoma
___ Verrucous carcinoma
___ Giant cell carcinoma
___ Lymphoepithelial carcinoma (non-nasopharyngeal)
___ Sinonasal undifferentiated carcinoma (SNUC)

Adenocarcinoma, Non-Salivary Gland Type
___ Intestinal type
    ___ Papillary-type
    ___ Colonic-type
    ___ Solid type
    ___ Mucinous type
    ___ Mixed type
___ Non-intestinal type
    ___ Low grade
    ___ Intermediate grade
    ___ High grade

Carcinomas of Minor Salivary Glands
___ Acinic cell carcinoma
___ Adenoid cystic carcinoma
___ Adenocarcinoma, not otherwise specified (NOS)
    ___ Low grade
    ___ Intermediate grade
    ___ High grade
___ Carcinoma ex pleomorphic adenoma (malignant mixed tumor)
___ Clear cell adenocarcinoma
___ Epithelial-myoepithelial carcinoma
___ Mucoepidermoid carcinoma:
    ___ Low grade
    ___ Intermediate grade
    ___ High grade
___ Myoepithelial carcinoma (malignant myoepithelioma)
___ Oncocytic carcinoma
___ Polymorphous low-grade adenocarcinoma
___ Salivary duct carcinoma
___ Other (specify): _____________________________________

* Data elements with asterisks are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
Neuroendocrine Carcinoma
___ Typical carcinoid tumor (well differentiated neuroendocrine carcinoma)
___ Atypical carcinoid tumor (moderately differentiated neuroendocrine carcinoma)
___ Small cell carcinoma (poorly differentiated neuroendocrine carcinoma)
___ Combined (or composite) small cell carcinoma, neuroendocrine type
___ Mucosal malignant melanoma
___ Other (specify): _____________________________________
___ Carcinoma, type cannot be determined

Histologic Grade (Note C)
___ Not applicable
___ GX: Cannot be assessed
___ G1: Well differentiated
___ G2: Moderately differentiated
___ G3: Poorly differentiated
___ Other (specify): _____________________________________

*Microscopic Tumor Extension
*Specify: _____________________________________

Margins (select all that apply) (Notes D and E)
___ Cannot be assessed
___ Margins uninvolved by invasive carcinoma
    Distance from closest margin: ___ mm or ___ cm
    Specify margin(s), per orientation, if possible: __________________
___ Margins involved by invasive carcinoma
    Specify margin(s), per orientation, if possible: __________________
___ Margins uninvolved by carcinoma in situ (includes moderate and severe dysplasia*) (Note D)
    Distance from closest margin: ___ mm or ___ cm
    Specify margin(s), per orientation, if possible: __________________
___ Margins involved by carcinoma in situ (includes moderate and severe dysplasia*) (Note D)
    Specify margin(s), per orientation, if possible: __________________
___ Not applicable

* Applicable only to squamous cell carcinoma and histologic variants.

*Treatment Effect (applicable to carcinomas treated with neoadjuvant therapy)
*___ Not identified
*___ Present (specify): __________________
*___ Indeterminate

Lymph-Vascular Invasion
___ Not Identified
___ Present
___ Indeterminate

* Data elements with asterisks are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
Perineural Invasion (Note F)
___ Not identified
___ Present
___ Indeterminate

Lymph Nodes, Extranodal Extension (Note G)
___ Not identified
___ Present
___ Indeterminate

Pathologic Staging (pTNM) (Note H)

TNM Descriptors (required only if applicable) (select all that apply)
___ m (multiple primary tumors)
___ r (recurrent)
___ y (post-treatment)

Primary Tumor (pT)
___ pTX: Cannot be assessed
___ pT0: No evidence of primary tumor
___ pTis: Carcinoma in situ

For All Carcinomas Excluding Mucosal Malignant Melanoma

Primary Tumor (pT): Maxillary Sinus
___ pT1: Tumor limited to maxillary sinus mucosa with no erosion or destruction of bone
___ pT2: Tumor causing bone erosion or destruction including extension into the hard palate and/or middle nasal meatus, except extension to posterior wall of maxillary sinus and pterygoid plates
___ pT3: Tumor invades any of the following: bone of the posterior wall of maxillary sinus, subcutaneous tissues, floor or medial wall of orbit, pterygoid fossa, ethmoid sinuses
___ pT4a: Moderately advanced local disease. Tumor invades anterior orbital contents, skin of cheek, pterygoid plates, infratemporal fossa, cribriform plate, sphenoid or frontal sinuses
___ pT4b: Very advanced local disease. Tumor invades any of the following: orbital apex, dura, brain, middle cranial fossa, cranial nerves other than maxillary division of trigeminal nerve (V2), nasopharynx, or clivus

Primary Tumor (pT): Nasal Cavity and Ethmoid Sinus
___ pT1: Tumor restricted to any one subsite, with or without bone invasion
___ pT2: Tumor invading two subsites in a single region or extending to involve an adjacent region within the nasoethmoidal complex, with or without bone invasion
___ pT3: Tumor extends to invade the medial wall or floor of the orbit, maxillary sinus, palate, or cribriform plate
___ pT4a: Moderately advanced local disease. Tumor invades any of the following: anterior orbital contents, skin of nose or cheek, minimal extension to anterior cranial fossa, pterygoid plates, sphenoid or frontal sinuses

* Data elements with asterisks are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
___ pT4b: Very advanced local disease. Tumor invades any of the following: orbital apex, dura, brain, middle cranial fossa, cranial nerves other than maxillary division of trigeminal nerve (V2), nasopharynx, or clivus

Regional Lymph Nodes (pN) *(Notes I through L)*

___ pNX: Cannot be assessed
___ pN0: No regional lymph node metastasis
___ pN1: Metastasis in a single ipsilateral lymph node, 3 cm or less in greatest dimension
___ pN2: Metastasis in a single ipsilateral lymph node, more than 3 cm but not more than 6 cm in greatest dimension, or in multiple ipsilateral lymph nodes, none more than 6 cm in greatest dimension, or in bilateral or contralateral nodes, none more than 6 cm in greatest dimension
___ pN2a: Metastasis in a single ipsilateral lymph node, more than 3 cm but not more than 6 cm in greatest dimension
___ pN2b: Metastasis in multiple ipsilateral lymph nodes, none more than 6 cm in greatest dimension
___ pN2c: Metastasis in bilateral or contralateral lymph nodes, none more than 6 cm in greatest dimension
___ pN3: Metastasis in a lymph node more than 6 cm in greatest dimension

Specify: Number of lymph nodes examined: ______
Number of positive lymph nodes: ________
*Size of the largest positive lymph node: _________ (Note K)
*Size of the associated metastatic focus: __________ (Note K)
*Position of the involved node (level): __________ (Note K)

# Metastases at level VII are considered regional lymph node metastases. Midline nodes are considered ipsilateral nodes.

Distant Metastasis (pM)
___ Not applicable
___ pM1: Distant metastasis
*Specify site(s) if known: _______________________
* Source of pathologic metastatic specimen (specify): _______________

For Mucosal Malignant Melanoma

Primary Tumor (pT)
___ pT3: Mucosal disease
___ pT4a: Moderately advanced disease. Tumor involving deep soft tissue, cartilage, bone, or overlying skin
___ pT4b: Very advanced disease. Tumor involving brain, dura, skull base, lower cranial nerves (IX, X, XI, XII), masticator space, carotid artery, prevertebral space, or mediastinal structures

Regional Lymph Nodes (pN)
___ pNX: Regional lymph nodes cannot be assessed
___ pN0: No regional lymph node metastases
___ pN1: Regional lymph node metastases present

* Data elements with asterisks are not required. However, these elements may be clinically important but are not yet validated or regularly used in patient management.
**Distant Metastasis (pM)**

___ Not applicable
___ pM1: Distant metastasis present
    *Specify site(s), if known: _______________________
    * Source of pathologic metastatic specimen (specify): _______________________

*Additional Pathologic Findings (select all that apply)*

*___ None identified*
*___ Carcinoma in situ *(Note M)*
*___ Epithelial dysplasia *(Note M)*
    *Specify: _______________________
*___ Inflammation (specify type): _______________________
*___ Squamous metaplasia*
*___ Epithelial hyperplasia*
*___ Colonization*
    *___ Fungal*
    *___ Bacterial*
*___ Other (specify): _______________________

*Ancillary Studies (Note N)*

*Specify type(s): _______________________
*Specify result(s): _______________________

*Clinical History (select all that apply)*

*___ Neoadjuvant therapy*
    *___ Yes (specify type): _______________________
    *___ No*
    *___ Indeterminate*
*___ Other (specify): _______________________

*Comment(s)*
Explanatory Notes

Scope of Guidelines
The reporting of oral cancer including the lip is facilitated by the provision of a checklist illustrating the features required for comprehensive patient care. However, there are many cases in which the individual practicalities of applying such a checklist may not be straightforward. Common examples include finding the prescribed number of lymph nodes, trying to determine the levels of the radical neck dissection, and determining if isolated tumor cells in a lymph node represent metastatic disease. Checklists have evolved to include clinical, radiographic, morphologic, immunohistochemical, and molecular results in an effort to guide clinical management. Adjuvant and neoadjuvant therapy can significantly alter histologic findings, making accurate classification an increasingly complex and demanding task. This checklist tries to remain simple while still incorporating important pathologic features as proposed by the American Joint Committee on Cancer (AJCC) cancer staging manual, the World Health Organization classification of tumours, the TNM classification, the American College of Surgeons Commission on Cancer, and the International Union on Cancer (UICC). This checklist is to be used as a guide and resource, an adjunct to diagnosing and managing cancers of the oral cavity in a standardized manner. It should not be used as a substitute for dissection or grossing techniques and does not give histologic parameters to reach the diagnosis. Subjectivity is always a factor, and elements listed are not meant to be arbitrary but are meant to provide uniformity of reporting across all the disciplines that use the information. It is a foundation of practical information that will help to meet the requirements of daily practice to benefit both clinicians and patients alike.

A. Anatomical Sites and Subsites for the Nasal Cavity and Paranasal Sinuses (Figure 1)
The nasal cavity is divided in the midline to right and left halves by the septum; each half opens on the face via the nares or nostrils and communicates behind with the nasopharynx through the posterior nasal apertures or the choanae. The nasal cavity is divided into 4 subsites including the septum, floor, lateral wall, and vestibule. The paranasal sinuses represent a grouping of 4 paired sinuses including the maxillary sinuses, ethmoid sinuses, frontal sinuses, and sphenoid sinuses. The nasoethmoidal complex is divided into 2 sites including the nasal cavity and the ethmoid sinuses.

Cancers of the maxillary sinuses are the most common sinonasal malignancies followed by cancers of the ethmoid sinuses, which are much less common. Cancers of the frontal and sphenoid sinuses are rare. When considering the nasal cavity and paranasal sinuses, 60% of malignant neoplasms originate from the maxillary sinus, 20% to 30% from the nasal cavity, 10% to 15% from the ethmoid sinus and 1% from the sphenoid and frontal sinuses. When only considering the paranasal sinuses, 77% of malignant neoplasms originate from the maxillary sinus, 22% from the ethmoid sinus, and 1% from the sphenoid and frontal sinuses.

The location as well as the extent of the mucosal lesion in the maxillary sinus has prognostic importance. Ohngren's line, connecting the medial canthus of the eye to the angle of the mandible, divides the maxillary sinus into an anterioinferior portion (infrastructure) and superioposterior portion (suprastructure) structures. Carcinomas of the infrastructure are associated with a good prognosis; carcinomas of the suprastructure are associated with a poor prognosis. The poorer prognosis with
carcinomas of the suprastructure reflects early access of these tumors to critical structures, including the eye, skull base, pterygoids, and infratemporal fossa.\textsuperscript{1}

![Diagram of nasal cavity and paranasal sinuses]

**Figure 1.** Anatomical sites and subsites for the nasal cavity and paranasal sinuses. From *AJCC Cancer Staging Manual*. 6th ed. New York: Springer; 2002. © American Joint Committee on Cancer. Reproduced with permission.

**B. Histological Type**

A modification of the World Health Organization (WHO) classification of carcinomas of the nasal cavity and paranasal sinuses is shown below.\textsuperscript{3} This list may not be complete. This protocol applies only to carcinomas and melanomas and does not apply to lymphomas, sarcomas or neuroectodermal tumors (eg, olfactory neuroblastoma, primitive neuroectodermal tumor [PNET], others).

**Nasal Cavity and Paranasal Sinuses**

- Squamous Cell Carcinoma, Conventional
  - Keratinizing
  - Nonkeratinizing (formerly cylindrical cell, transitional cell)

  Variants of Squamous Cell Carcinoma (*in alphabetical order*)
  - Acantholytic squamous cell carcinoma
  - Adenosquamous carcinoma
  - Basaloid squamous cell carcinoma
  - Papillary squamous cell carcinoma
Spindle cell squamous cell carcinoma
Verrucous carcinoma

Giant cell carcinoma#
Lymphoepithelial carcinoma (non-nasopharyngeal)
Sinonasal undifferentiated carcinoma (SNUC)

Adenocarcinoma, Non-Salivary Gland Type
  Intestinal-type
  Non-intestinal type

Carcinomas of Minor Salivary Glands
  Acinic cell carcinoma
  Adenoid cystic carcinoma
  Adenocarcinoma, not otherwise specified (NOS)
  Carcinoma ex pleomorphic adenoma (malignant mixed tumor)
  Clear cell adenocarcinoma
  Mucoepidermoid carcinoma:
    Epithelial-myoepithelial carcinoma
    Myoepithelial carcinoma (malignant myoepithelioma)
  Oncocytic carcinoma
  Polymorphous low-grade adenocarcinoma
  Salivary duct carcinoma
  Other

Neuroendocrine Carcinoma
  Typical carcinoid tumor (well differentiated neuroendocrine carcinoma)
  Atypical carcinoid tumor (moderately differentiated neuroendocrine carcinoma)
  Small cell (undifferentiated) carcinoma (poorly differentiated neuroendocrine carcinoma)
  Combined (or composite) small cell carcinoma, neuroendocrine type##

Mucosal Malignant Melanoma

# Not included in WHO classification.

## Represents a carcinoma showing combined features of small cell neuroendocrine carcinoma associated with a squamous or adenocarcinomatous component.

C. Histologic Grade
For histologic types of carcinomas that are amenable to grading, 3 histologic grades are suggested, as shown below. When a tumor manifests more than 1 grade of differentiation, the surgical report must designate both the highest and the most prevalent tumor grades.

Grade X  Cannot be assessed
Grade 1   Well differentiated
Grade 2   Moderately differentiated
Grade 3   Poorly differentiated
This grading system does not apply to all salivary gland tumors. The histologic (microscopic) grading of salivary gland carcinomas has been shown to be an independent predictor of behavior and plays a role in optimizing therapy. Further, there is often a positive correlation between histologic grade and clinical stage. For the majority of salivary gland carcinomas there is only a single histologic grade and classification alone determines the histologic grade (eg, acinic cell carcinoma is a histologically low-grade carcinoma; salivary duct carcinoma is a histologically high-grade carcinoma). With some exceptions, histologic grading is predicated on cytomorphologic features. In this histologic grading scheme, 3 histologic grades are suggested, as follows:

Grade 1 Well differentiated = Low-grade
Grade 2 Moderately differentiated = Intermediate-grade
Grade 3 Poorly differentiated = High-grade
Grade X Cannot be assessed

When a tumor manifests more than 1 grade of differentiation, the surgical report must designate both the highest and the most prevalent tumor grades. In some carcinomas, histologic grading may be based on growth pattern, such as in adenoid cystic carcinoma, for which a histologic high-grade variant has been recognized based on the percentage of solid growth. Those adenoid cystic carcinomas showing 30% or greater of solid growth pattern are considered to be histologically high-grade carcinomas. The histologic grading of mucoepidermoid carcinoma includes a combination of growth pattern characteristics (eg, cystic, solid, neurotropism) and cytomorphologic findings (eg, anaplasia, mitoses, necrosis).

D. Surgical Margins

Reporting of surgical margins should include information regarding the distance of invasive carcinoma, carcinoma in situ or high grade dysplasia (moderate to severe) from the surgical margin. Closeness of the above, microscopically less than 5 mm, from the surgical border should be noted in the report. Presence of the above lesions found within 5 mm of the surgical border carry a significant risk for subsequent local recurrence. Reporting of surgical margins for carcinomas of the minor salivary glands should follow those used for squamous cell carcinoma of oral cavity. There is no category of carcinoma in situ relative to carcinomas of salivary glands (major, minor).

Unlike the oral cavity and larynx, intraepithelial dysplasias including nonkeratinizing and keratinizing dysplasias as well as carcinoma in situ of the nasal cavity and paranasal sinuses are uncommon, especially as an isolated clinical and/or histopathologic lesion. In the sinonasal tract, when carcinoma in situ is identified, it usually is seen in association with an invasive carcinoma. In this setting, the same criteria detailed in the oral cavity and laryngeal protocols apply (see Protocol for the Examination of Specimens from Patients with Carcinomas of the Lip and Oral Cavity and Protocol for the Examination of Specimens from Patients with Carcinomas of the Larynx).

E. Orientation of Specimen

Complex specimens should be examined and oriented with the assistance of attending surgeons. Direct communication between the surgeon and pathologist is a critical component in specimen orientation and proper sectioning. Whenever possible, the tissue examination request form should include a drawing of the resected specimen showing the extent of the tumor and its relation to the anatomic structures of the region.
The lines and extent of the resection can be depicted on preprinted adhesive labels and attached to the surgical pathology request forms.

F. Perineural Invasion
The presence of perineural invasion (neurotropism) is an important predictor of poor prognosis in head and neck cancer of virtually all sites.\textsuperscript{19} The presence of perineural invasion (neurotropism) in the primary cancer is associated with poor local disease control and regional control, as well as being associated with metastasis to regional lymph nodes.\textsuperscript{19} Further, perineural invasion is associated with decrease in disease-specific survival and overall survival.\textsuperscript{19} There is conflicting data relative to an association between the presence of perineural invasion and the development of distant metastasis with some studies showing an increased association with distant metastasis but other studies not showing any correlation with distant metastasis.\textsuperscript{19} The relationship between perineural invasion and prognosis is independent of nerve diameter.\textsuperscript{20} Although perineural invasion of small unnamed nerves may not produce clinical symptoms, the reporting of perineural invasion includes nerves of all sizes including small peripheral nerves (ie, less than 1 mm in diameter). Aside from the impact on prognosis, the presence of perineural invasion also guides therapy. Concurrent adjuvant chemoradiation therapy has been shown to improve outcomes in patients with perineural invasion (as well as in patients with extranodal extension and bone invasion).\textsuperscript{21,22} Given the significance relative to prognosis and treatment, perineural invasion is a required data element in the reporting of head and neck cancers.

G. Extranodal Extension
The status of cervical lymph nodes is the single most important prognostic factor in aerodigestive cancer. All macroscopically negative or equivocal lymph nodes should be submitted in toto. Grossly positive nodes may be partially submitted for microscopic documentation of metastasis. Reporting of lymph nodes containing metastasis should include whether there is presence or absence of extranodal extension (EE). This finding consists of extension of metastatic tumor, present within the confines of the lymph node, through the lymph node capsule into the surrounding connective tissue, with or without associated stromal reaction. If macroscopic examination suggests EE, this tissue should be submitted for microscopic confirmation. EE is a predictor of regional relapse and a criterion for postoperative radiotherapy.\textsuperscript{23-26}

H. TNM and Stage Groupings
The protocol recommends the TNM staging system of the American Joint Committee on Cancer (AJCC) and the International Union Against Cancer (UICC) for nasal cavity and paranasal sinus cancer.\textsuperscript{1,27} Of note in the 7th edition of the AJCC staging of head and neck cancers\textsuperscript{1} is the division of T4 lesions into T4a (moderately advanced local disease) and T4b (very advanced local disease), leading to the stratification of stage IV into stage IVA (moderately advanced local/regional disease), stage IVB (very advanced local/regional disease), and stage IVC (distant metastatic disease).

The 7th edition of the AJCC staging of head and neck cancers includes mucosal malignant melanomas.\textsuperscript{1} Approximately two-thirds of mucosal malignant melanomas arise in the sinonasal tract, one-quarter are found in the oral cavity and the remainder occur only sporadically in other mucosal sites of the head and neck.\textsuperscript{1} Even small cancers behave aggressively with high rates of recurrence and death.\textsuperscript{1} To reflect this aggressive behavior, primary cancers limited to the mucosa are considered T3 lesions. Advanced
mucosal melanomas are classified as T4a and T4b. The anatomic extent criteria to define *moderately advanced* (T4a) and *very advanced* (T4b) disease are given below. The AJCC staging for mucosal malignant melanomas does not provide for the histologic definition of a T3 lesion; as the majority of mucosal malignant melanomas are invasive at presentation, mucosal based melanomas (T3 lesions) include those lesions that involve either the epithelium and/or lamina propria of the involved site. Rare examples of *in situ* mucosal melanomas occur but *in situ* mucosal melanomas are excluded from staging, as they are extremely rare.¹

**For All Carcinomas Excluding Mucosal Malignant Melanoma**

**Primary Tumor: Maxillary Sinus**
- **TX**: Cannot be assessed
- **T0**: No evidence of primary tumor
- **Tis**: Carcinoma in situ
- **T1**: Tumor limited to the maxillary sinus mucosa with no erosion or destruction of bone
- **T2**: Tumor causing bone erosion or destruction including extension into the hard palate and/or middle nasal meatus, except extension to posterior wall of maxillary sinus and pterygoid plates
- **T3**: Tumor invades any of the following: bone of the posterior wall of maxillary sinus, subcutaneous tissues, floor or medial wall of orbit, pterygoid fossa, ethmoid sinuses
- **T4a**: Tumor invades anterior orbital contents, skin of cheek, pterygoid plates, infratemporal fossa, cribiform plate, sphenoid or frontal sinuses
- **T4b**: Tumor invades any of the following: orbital apex, dura, brain, middle cranial fossa, cranial nerves other than maxillary division of trigeminal nerve (V₂), nasopharynx, or clivus

**Primary Tumor: Nasal Cavity and Ethmoid Sinus**
- **TX**: Cannot be assessed
- **T0**: No evidence of primary tumor
- **Tis**: Carcinoma in situ
- **T1**: Tumor restricted to any one subsite, with or without bone invasion
- **T2**: Tumor invading two subsites in a single region or extending to involve an adjacent region within the nasoethmoidal complex, with or without bone invasion
- **T3**: Tumor extends to invade the medial wall or floor of the orbit, maxillary sinus, palate, or cribiform plate
- **T4a**: Tumor invades any of the following: anterior orbital contents, skin of nose or cheek, minimal extension to anterior cranial fossa, pterygoid plates, sphenoid or frontal sinuses
- **T4b**: Tumor invades any of the following: orbital apex, dura, brain, middle cranial fossa, cranial nerves other than maxillary division of trigeminal nerve (V₂), nasopharynx, or clivus

**Regional Lymph Nodes**
- **NX**: Cannot be assessed
- **N0**: No regional lymph node metastasis
- **N1**: Metastasis in a single ipsilateral lymph node, 3 cm or less in greatest dimension
N2   Metastasis in a single ipsilateral lymph node, more than 3 cm but not more than 6 cm in greatest dimension, or in multiple ipsilateral lymph nodes, none more than 6 cm in greatest dimension, or in bilateral or contralateral nodes, none more than 6 cm in greatest dimension
N2a  Metastasis in a single ipsilateral lymph node, more than 3 cm but not more than 6 cm in greatest dimension
N2b  Metastasis in multiple ipsilateral lymph nodes, none more than 6 cm in greatest dimension
N2c  Metastasis in bilateral or contralateral lymph nodes, none more than 6 cm in greatest dimension
N3   Metastasis in a lymph node more than 6 cm in greatest dimension

Metastases at level VII are considered regional lymph node metastases. Midline nodes are considered ipsilateral nodes.

Distant Metastasis
M0   No distant metastasis
M1   Distant metastasis

For Mucosal Malignant Melanoma

Primary Tumor
T3   Mucosal disease
T4a  Moderately advanced disease. Tumor involving deep soft tissue, cartilage, bone, or overlying skin
T4b  Very advanced disease. Tumor involving brain, dura, skull base, lower cranial nerves (IX, X, XI, XII), masticator space, carotid artery, prevertebral space, or mediastinal structures

Regional Lymph Nodes
NX   Regional lymph nodes cannot be assessed
N0   No regional lymph node metastases
N1   Regional lymph node metastases present

Distant Metastasis
M0   No distant metastasis
M1   Distant metastasis present

By AJCC/UICC convention, the designation “T” refers to a primary tumor that has not been previously treated. The symbol “p” refers to the pathologic classification of the TNM, as opposed to the clinical classification, and is based on gross and microscopic examination. pT entails a resection of the primary tumor or biopsy adequate to evaluate the highest pT category, pN entails removal of nodes adequate to validate lymph node metastasis, and pM implies microscopic examination of distant lesions. Clinical classification (cTNM) is usually carried out by the referring physician before treatment during initial evaluation of the patient or when pathologic classification is not possible.

Pathologic staging is usually performed after surgical resection of the primary tumor. Pathologic staging depends on pathologic documentation of the anatomic extent of disease, whether or not the primary tumor has been completely removed. If a biopsied tumor is not resected for any reason (eg, when technically unfeasible) and if the highest
T and N categories or the M1 category of the tumor can be confirmed microscopically, the criteria for pathologic classification and staging have been satisfied without total removal of the primary cancer.

**TNM Descriptors**

For identification of special cases of TNM or pTNM classifications, the “m” suffix and “y” and “r” prefixes are used. Although they do not affect the stage grouping, they indicate cases needing separate analysis.

The “m” suffix indicates the presence of multiple primary tumors in a single site and is recorded in parentheses: pT(m)NM.

The “y” prefix indicates those cases in which classification is performed during or following initial multimodality therapy (ie, neoadjuvant chemotherapy, radiation therapy, or both chemotherapy and radiation therapy). The cTNM or pTNM category is identified by a “y” prefix. The ycTNM or ypTNM categorizes the extent of tumor actually present at the time of that examination. The “y” categorization is not an estimate of tumor prior to multimodality therapy (ie, before initiation of neoadjuvant therapy).

The “r” prefix indicates a recurrent tumor when staged after a documented disease-free interval, and is identified by the “r” prefix: rTNM.

**Additional Descriptors**

**Residual Tumor (R)**

Tumor remaining in a patient after therapy with curative intent (eg, surgical resection for cure) is categorized by a system known as R classification, shown below.

- RX Presence of residual tumor cannot be assessed
- R0 No residual tumor
R1  Microscopic residual tumor
R2  Macroscopic residual tumor

For the surgeon, the R classification may be useful to indicate the known or assumed status of the completeness of a surgical excision. For the pathologist, the R classification is relevant to the status of the margins of a surgical resection specimen. That is, tumor involving the resection margin on pathologic examination may be assumed to correspond to residual tumor in the patient and may be classified as macroscopic or microscopic according to the findings at the specimen margin(s).

I. Classification of Neck Dissection
1. Radical neck dissection
2. Modified radical neck dissection, internal jugular vein and/or sternocleidomastoid muscle spared
3. Selective neck dissection (SND), as specified by the surgeon
   a. Supraomohyoid neck dissection
   b. Posterolateral neck dissection
   c. Lateral neck dissection
   d. Central compartment neck dissection
4. Selective neck dissection (SND), as specified by the surgeon -“SND” with levels and sublevels designated (Figure 2).28-30
5. Extended radical neck dissection, as specified by the surgeon

J. Regional Lymph Nodes (pN0): Isolated Tumor Cells
Isolated tumor cells (ITCs) are single cells or small clusters of cells not more than 0.2 mm in greatest dimension. Lymph nodes or distant sites with ITCs found by either histologic examination, immunohistochemistry, or non-morphologic techniques (eg, flow cytometry, DNA analysis, polymerase chain reaction [PCR] amplification of a specific tumor marker) should be classified as N0 or M0, respectively. Specific denotation of the assigned N category is suggested as follows for cases in which ITCs are the only evidence of possible metastatic disease.27,31,32

pN0  No regional lymph node metastasis histologically, no examination for isolated tumor cells (ITCs)
pN0(i-)  No regional lymph node metastasis histologically, negative morphologic (any morphologic technique, including hematoxylin-eosin and immunohistochemistry) findings for ITCs
pN0(i+)  No regional lymph node metastasis histologically, positive morphologic (any morphologic technique, including hematoxylin-eosin and immunohistochemistry) findings for ITCs
pN0(mol-)  No regional lymph node metastasis histologically, negative non-morphologic (molecular) findings for ITCs
pN0(mol+)  No regional lymph node metastasis histologically, positive non-morphologic (molecular) findings for ITCs

For purposes of pathologic evaluation, lymph nodes are organized by levels as shown in Figure 2.33
In order for pathologists to properly identify these nodes, they must be familiar with the terminology of the regional lymph node groups and with the relationships of those groups to the regional anatomy. Which lymph node groups surgeons submit for histopathologic evaluation depends on the type of neck dissection they perform. Therefore, surgeons must supply information on the types of neck dissections that they perform and the details of the local anatomy in the specimens they submit for examination or, in other manners, orient those specimens for pathologists.

If it is not possible to assess the levels of lymph nodes (for instance, when the anatomic landmarks in the excised specimens are not specified), then the lymph node levels may be estimated as follows: level II, upper third of internal jugular (IJ) vein or neck specimen; level III, middle third of IJ vein or neck specimen; level IV, lower third of IJ vein or neck specimen, all anterior to the sternocleidomastoid muscle.

**Level I. Submental Group (Sublevel IA)**
Lymph nodes within the triangular boundary of the anterior belly of the digastric muscles and the hyoid bone.

**Level I. Submandibular Group (Sublevel IB)**
Lymph nodes within the boundaries of the anterior and posterior bellies of the digastric muscle and the body of the mandible. The submandibular gland is included in the specimen when the lymph nodes within this triangle are removed.

**Level II. Upper Jugular Group (Sublevels IIA and IIB)**
Lymph nodes located around the upper third of the internal jugular vein and adjacent spinal accessory nerve extending from the level of the carotid bifurcation (surgical landmark) or hyoid bone (clinical landmark) to the skull base. The posterior boundary is
the posterior border of the sternocleidomastoid muscle, and the anterior boundary is the lateral border of the sternohyoid muscle.

**Level III. Middle Jugular Group**
Lymph nodes located around the middle third of the internal jugular vein extending from the carotid bifurcation superiorly to the omohyoid muscle (surgical landmark), or cricothyroid notch (clinical landmark) inferiorly. The posterior boundary is the posterior border of the sternocleidomastoid muscle, and the anterior boundary is the lateral border of the sternohyoid muscle.

**Level IV. Lower Jugular Group**
Lymph nodes located around the lower third of the internal jugular vein extending from the omohyoid muscle superiorly to the clavicle inferiorly. The posterior boundary is the posterior border of the sternocleidomastoid muscle, and the anterior boundary is the lateral border of the sternohyoid muscle.

**Level V. Posterior Triangle Group (Sublevels VA and VB)**
This group comprises predominantly the lymph nodes located along the lower half of the spinal accessory nerve and the transverse cervical artery. The supraclavicular nodes are also included in this group. The posterior boundary of the posterior triangle is the anterior border of the trapezius muscle, the anterior boundary of the posterior triangle is the posterior border of the sternocleidomastoid muscle, and the inferior boundary of the posterior triangle is the clavicle.

**Level VI. Anterior (Central) Compartment**
Lymph nodes in this compartment include the pre- and paratracheal nodes, precricoid (Delphian) node, and the perithyroidal nodes, including the lymph nodes along the recurrent laryngeal nerve. The superior boundary is the hyoid bone, the inferior boundary is the suprasternal notch, the lateral boundaries are the common carotid arteries and the posterior boundary by the prevertebral fascia.

**Level VII. Superior Mediastinal Lymph Nodes**
Metastases at level VII are considered regional lymph node metastases; all other mediastinal lymph node metastases are considered distant metastases.

Lymph node groups removed from areas not included in the above levels, eg, scalene, suboccipital, and retropharyngeal, should be identified and reported from all levels separately. Midline nodes are considered ipsilateral nodes.

**K. Lymph Nodes**

**Lymph Node Number**
Histological examination of a selective neck dissection specimen will ordinarily include 6 or more lymph nodes. Histological examination of a radical or modified radical neck dissection specimen will ordinarily include 10 or more lymph nodes in the untreated neck.

**Measurement of Tumor Metastasis**
The cross-sectional diameter of the largest metastasis in a lymph node containing metastatic tumor is measured in the gross specimen at the time of macroscopic examination or, if necessary, on the histologic slide at the time of microscopic
examination. There is conflicting data in the literature on the significance of the size of the largest metastatic lymph node on the risk of regional recurrence and a predictor of poor overall survival. While the diameter of the largest positive lymph node may potentially serve as a predictor of outcome, it may not represent an independent predictor of outcome when other pathologic factors are considered.

L. Special Procedures for Lymph Nodes
At the current time, no additional special techniques should be used other than routine histology for the assessment of nodal metastases. Immunohistochemistry and PCR to detect isolated tumor cells are considered investigational techniques at this time.

M. Dysplasia of the Upper Aerodigestive Tract (UADT)
Epithelial dysplasias of the nasal cavity and paranasal sinuses as a precursor lesion for sinonasal carcinomas are less common and less well defined as compared to epithelial dysplasias of the oral cavity and the larynx. Further, unlike dysplastic lesions of the oral cavity and/or the larynx, precursor lesions of the nasal cavity and paranasal sinuses are generally asymptomatic and therefore are not biopsied. Instead, they are identified more often in association with another lesion, such as an invasive carcinoma.

N. Ancillary Studies
At the current time, no additional special techniques are required other than routine histology for the assessment of nasal cavity and paranasal sinus carcinomas. Immunohistochemistry and in situ hybridization (ISH) to detect the presence of viruses (eg, human papillomavirus, Epstein-Barr virus) are considered investigational techniques at this time.
